A new classification for hepatocellular carcinoma with hepatic vein tumor thrombus. A new classification was established to predict prognosis of HCC patients with hepatic vein tumor thrombus (HVTT) who underwent different treatments. This classification was superior to, and it may serve as a supplement to, the commonly used staging systems ...

Introduction. Hemangioma is the most common benign hepatic tumor. The prevalence of hemangioma in the general population ranges from 1%–2% (, 1) to 20% (, 2); the female-to-male ratio varies from 2:1 to 5:1. Because hepatic hemangiomas are frequent, are most often asymptomatic, and have a very low rate of complications, this lesion does not require surgical resection.

Abstract: Serum carbohydrate antigen 19-9 (CA19-9), a common tumor marker, is frequently increased in bile duct malignancy. We reported a case with an extremely increased CA19-9 level due to benign common bile duct stones and gallstones. A 63-year-old male presented with intermittent right upper quadrant abdominal pain for 1 year.

Cutaneous wound healing is the process by which skin repairs itself. It is generally accepted that cutaneous wound healing can be divided into 4 phases: haemostasis, inflammation, proliferation, and remodelling. In humans, keratinocytes re-form a functional epidermis (reepithelialization) as rapidly as possible, closing the wound and reestablishing tissue homeostasis.

Introduction. Cancer incidence and mortality have been increasing in China, making cancer the leading cause of death since 2010 and a major public health problem in the country. 1 Much of the rising burden is attributable to population growth and ageing and to sociodemographic changes. Although previous estimates of the national incidence rates have been reported, they either represented a ...
